                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel monoclonal antibody used for inhibiting tumour growth in an animal. The tumour inhibition process comprises selecting an animal in need of treatment for a tumour, providing a monoclonal antibody comprising a heavy chain amino acid, where the antibody consists of any one of 10 fully defined sequences of 117-123 amino acids given in the specification, and where the monoclonal antibody binds MUC18, and contacting the tumour with the antibody resulting in inhibited proliferation of the cells. The monoclonal antibody has overstant and an be used in the production of a vaccine. The monoclonal antibodies against the MUC18 antigen are useful for diagnosing and treating tumours, inhibiting cumour growth (e.g. melanoma, lung tumour or tumour metaersais), inhibiting call invasion associated with melanoma, or increasing survival of an animal having a metaetatic tumour. This sequence represents an anti-MUC18 antibody light chain, variable region,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises a method for inhibiting cell proliferation associated with expression of NUC18 tumour antigen. The method involves administering anti-MUC18 monoclonal antibody. The method of the invention is useful for inhibiting cell (e.g. melanoma or tumour cell) proliferation associated with the expression of MUC18 tumour antigen, the method is preferably useful for inhibiting cell proliferation in patients with tumours, carcinomas, cancer and other malignancies. The present amino acid sequence represents a light chain from an MUC18 tumour antigen-specific monoclonal antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                     9
                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inhibiting cell proliferation associated with expression of MUC18 tumor antigen, involves incubating and inhibiting cell by administering anti-MUC18 monoclonal antibody.

Buch \* recombinant human monoclonal antibody that specifically binds to nor Necrosis Factor-alpha, useful for treating neoplastic disease such cancers, or immuno-mediated inflammatory diseases such as rheumatoid arthritis

Example 10; SEQ ID NO 318; 213pp; English.

The present invention describes a human monoclonal antibody (1) that specifically binds to tumour necrosis factor-alpha (TNFa) and comprises:

(a) a heavy chain complementarity determining region 1 (CDR1) having the two fully defined 5 amino acid sequence (81, ADP22417) or (82, ADP22421);

and (b) a light chain CDR1 having the two fully defined 11 amino acid sequence (83, ADP2242424). Also described: (1) assaying (M1) the level of TNFa in a patient sample, comprising contacting with (1), and detecting the level of binding between the antibody and TNFa in the sample; (2) a composition comprising the antibody or its functional fragment and a carrier; (3) treating (M2) an animal suffering from a neoplastic, or an immuno-mediated inflammatory disease by selecting an animal in need of treatment for the disease by administering the human monoclonal antibody of (1); and (4) inhibiting (M3) TNFa induced apoptosis by administering the human monoclonal antibody of (1); antibacteriosclerotic, antiarthitic, antiarteriosclerotic, antiarthitic, antiarteriosclerotic, antiarteriosclerotic, antiartened (2); antiarteriosclerotic, antiartened (2); antiartened (2); antiartened (2); antiartened (2); antiartened (2); antiartened (3); antiartened (3) stomach cancer, endometrial cancer, kidney cancer, colon cancer,

ö
 AAU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid sequences of anti-adipocyte monoclonal antibody heavy chain. light chain, and heavy chain complementarity determining regions (CDR) of the invention. The antibodies can be used in the treatment of obesity and obesity related diseases. The antibodies can be used to deliver drugs or pro-drugs directly to the fat mass of an obese patient or the antibody can be used as a therapeutic itself. Antibodies binding specifically to adipocytes can be used to activate the immune system to destroy the cells by complement mediated lysis. The antibodies may be labeled with a detectable label such as radiolabel, fluorescent or chemical group and used in methods of diagnosis in human subjects e.g. to determine the presence of adipocyte antigen on the surface of an adipocyte to detect or determine the presence or level of adipocytes in a cell or tissue sample. The antibodies can be used as an alternative means of treatment for obese

using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XL1 Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAD regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive clones. The light chain VK region sequence AARS4319 neutralises HIV1 gpl20. (Updated on 25-MAR-2003 to correct PN field.)

second polynucleotide encoding a light chain immunoglobulin amino acid sequence; (b) inscrting the first and second polynucleotide sequences into a host cell; (c) maintaining the host cell in conditions which allow the amino acid sequences encoded by the polynucleotides to be expressed in the host cell; and (d) isolating the antibody comprising the heavy and light chain immunoglobulin amino acid sequences from the host cell; The arti-HIV gp-120 monoclonal antibody is used for providing passive anti-HIV gp-120 monoclonal antibody is used for providing passive carti-HIV gp-120 monoclonal antibody is used for providing passive anti-HIV gp-120 monoclonal antibody is used for patients to reduce the likelihood and/or severity of HIV-induced disease and to patients who are already HIV-infected. The antibodies are used for neutralising field isolates which provides information about the meunocompetence of an immune response in HIV patients, for detecting HIV in a biological fluid or tissue sample e.g. by radioimmunosssay, for producing anti-idiotypic antibodies which can be used for active immunisation and to screen human monoclonal antibodies to identify those with the same binding specificity and to monitor the course of HIV present in the body or in body fluides by immunosssay. The anti-HIV gp-120
 ö
 The sequences given in AAW01261-92 represent the light chain variable regions (VL) of a series of monoclonal antibodies (MAb's) which are immunoreactive with HIV glycoprotein gp120 and are capable of neutralising HIV. This sequence represents the sequence of the JK4 gene clone, B26. A MAb containing this VL sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml, and binds mature gp120 preferentially over the precursor gp160. The MAb may be used for detection of HIV infection

This sequence represents a fragment of the antibodies of the invention. The invention relates to the production of an anti-HIV (human immunodeficiency virus) glycoprotein (gp)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of less than 70 mg/ml. The method for the production of the antibody comprises: (a) providing a first polynucleotide encoding a heavy chain immunoglobulin amino acid sequence (which does not comprise the sequence represented by AAY99206) and a

immunodeficiency virus types 1 (HV-1) antibody. The invention relates to a human whole immunoglobulin (Ig) molecule which immunoreacts with HIV mature glycoprotein ppl20 preferentially over HIV precursor glycoprotein ppl20 preferentially over HIV precursor glycoprotein ppl20 preferentially over HIV precursor glycoprotein in vitro virus infectivity assay by 50%, at a concentration of less than in vitro virus infectivity assay by 50%, at a concentration of less than in vitro virus infectivity assay by 50%, at a concentration of less than in vitro virus infectivity assay by 50%, at a concentration of less than in vitro virus infectivity assay by 50%, at a concentration of less than in vitro virus infectivity as eagents for the diagnosis and immunocompetence of an immune response in HIV infected patients. The immunocompetence of an immune response in HIV infected patients. The immunocompetence of an immune response in HIV infected patients. The immunocompetence of an immune response in HIV infected patients which can be used to screen human monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the HIV gp120 and gp41 glycoproteins, thus increasing the availability of new immunotherapeutic human monoclonal antibodies. A major advantages of the monoclonal antibodies derives from the fact that they are encoded by a
 human polynucleotides sequence. Thus in vivo use of the monoclonal antibodies for diagnosis and immunotherapy of HIV induced disease greatly reduces the problems of significant host immune response to the passively administered antibodies which is a problem commonly encountered when monoclonal antibodies of xenogeneic or chimeric derivation are utilized. An additional major advantage of the monoclonal antibodies described derives from the fact that they immunoreact with a unique determinant present on mature HIV glycoprotein gpl20. This class of antibodies is particularly effective at neutralising field isolates of HIV

prostate-specific antigen (PSA) and anti-chymotrypain (ACT), and has an affinity for the complex which is at least 10 fold higher than the affinity for the complex which is at least 10 fold higher than the affinity for either PSA or ACT alone. The antibody is used in diagnostic assays to detect PSA-ACT alone. The antibody is used in diagnostic compared to the levels in patients suffering from prostate cancer compared to the levels in patients with benign or no growths in the prostate. Therefore detection of PSA in complex with ACT is useful for the early detection of prostate tumours, by distinguishing between benign and malignant conditions of the prostate as well as for the management of patients with prostate cancer, such as the disclosure of metastasis and the monitoring of the PSA levels after treatment. The antibodies may also be used in immunotherapy, affinity chromatography and isolation or purification of PSA-ACT. Unlike prior art antibodies which bind to PSA-ACT complexes but may also bind PSA or ACT alone, the present antibody is specific for PSA-ACT alone. Diagnostic assays using the antibodies are incore accurate in diagnosing prostate cancer as they only detect the cintact complex of PSA-ACT. Sequences AAV21880-884 represent specific examples of antibodies directed against PSA-ACT. The present sequence represents the amino acid sequence of antibody ITA7

 The present invention describes a human heterodimeric antibody (I) (fragment) having a binding affinity of at least 1x10-8 M to the protective antigen of Bacillus anthracis or a molecule involved in anthrax infection that blocks binding of the antigen or molecule to cell receptors, edema factor and lethal factor. (I) has virucide and antibacterial activities, and can be used in immunotherapy. The antibacterial activities, and can be used in immunotherapy. The antibodies (I) are useful as anti-toxins or anti-infectives with respect to infective agents, such as anthrax, botulinum, smallpox, Venezuelan expense of the compalance represents a human heterodimeric antibody light chain kappa region amino acid sequence, which is used in the exemplification of
 New human heterodimeric antibodies or their antibody fragments, useful as anti-toxins or anti-infectives with respect to infective agents, e.g. anthrax, botulinum, smallpox, Venezuelan equine encephalomyelitis or West

The present invention relates to a human monoclonal antibody that binds to monocyte chemo-attractant protein-1 (MCP-1). The antibody is useful for the preparation of a medicament useful for treating neoplastic or inflammatory conditions. The neoplastic disease is selected from breast cancer, bladder cancer, lung cancer, glioblastoma, stomach cancer, endometrial cancer, kidney cancer, colon cancer, pancreatic cancer or prostrate cancer. He inflammatory condition is selected from rheumatoid arthritis, glomerulonephritis, atherosoclerosis, psoriasis, restenosis, autoimmune disease or multiple sclerosis. The antibodies are also useful for diagnosing the above diseases. It is also useful for the determining the level of MCP-1 and MCP-1 family members in patient samples. The present sequence represents a human anti-MCP-1 variable region light chain sequence.

interleukin-5, useful for diagnosing, treating or preventing a condition associated with undesired interleukin-5 activity, e.g. asthma or allergic

Claim 2; Page 26; 75pp; English

The present sequence is the protein sequence of the light chain of anticuman interlewin-5 (IL-5) human monoclonal antibody (MAD) 20.13.3 To obtain this 1964 MAD. XenoMice (TW) were immunised with human IL-5; obtain this 1964 MAD. XenoMice (TW) were immunised with human IL-5; obtain this 1964 MAD. XenoMice (TW) were immunised with human IL-5; spleen and/or lymph nodes were then fused with myeloma 9-X63-Ag8.653 or resents equence. Or nucleotides 1-707, 1102-1137, 126-1585, 1683-2002, 58-709, and I48-381 of it, are claimed and used in methods of the invention relates to antibodies or their antigen-binding crayments that specifically bind IL-5. Human anti-IL-5 antibodies are provided, including chimeric, bispecific, derivatised, single chain crathent. The invention also provides gene therapy methods using nucleic antibodies or private the appendication of displace therapy methods using nucleic creatment. The invention also provides gene therapy methods using nucleic creatment. The invention also provides gene therapy methods using nucleic creatment. The invention also provides gene therapy methods using nucleic caids encoding the heavy and/or light chain molecules that comprise the undealted IL-5 antibodies, and transgenic animals. The antibodies can be used to prevent or inhibit a condition or disorder characterised by undealted IL-5 antibodies, and transgenic animals. The antibodies and callergic rhinitis, allergic bronchopulmonary aspergillosis, hypercosinophilis, churg-Strauss syndrome, atopic dermatitis, presentionphilis, churg-Strauss syndrome, atopic dermatitis, presention of disease, eosinophilic gastroenterits, chimically hypercosinophilic myalage engles of simusitis, creaponse in a subject confluentivitis, by decreasing or inhibiting the infilitration of simusitis, creaponse in a subject confluentivitis, by decreasing or inhibiting the indicated event, such as eosinophilis activation, migration into the bloodstream, adhesion to confluention, airway hyperresponsiveness, pulmonary epithelial and servived al

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New human anti-MUC18 monoclonal antibodies, useful for treating a disease or condition associated with expression of MUC18 in a patient, e.g. tumors, cancers, and other malignancies.

Claim 3; SEQ ID NO 30; 78pp; English.

a heavy or light chain amino acid or a heavy or light chain variable domain where the antibody binds to MUC18. The monoclonal antibody of the invention demonstrates cytostatic activity and may be useful for treating a disease or condition associated with the expression of MUC18 on the cell surface such as tumours, specifically melanoma, oesophageal, pancreatic or colorectal tumours, carcinomas, particularly cervical carcinomas and cervical intraepithelial neoplasia and cancers including colorectal, breast or lung cancer, as well as other malignancies. The current sequence is that of the anti-human MUC18 monoclonal antibody comprising The invention relates to a novel isolated monoclonal antibody

 The invention relates to a novel monoclonal antibody used for inhibiting tumour growth in an animal. The tumour inhibition process comprises selecting an animal in need of treatment for a tumour, providing a monoclonal antibody comprising a heavy chain amino acid, where the antibody consists of any one of 10 fully defined sequences of 117-123 antibody consists of any one of 10 fully defined sequences of 117-123 binds MUC18, and contacting the tumour with the antibody resulting in inhibited proliferation of the cells. The monoclonal antibody has oversetted and can be used in the production of a vaccine. The monoclonal antibodies against the MUC18 antigen are useful for diagnosing and treating tumours, inhibiting cumour growth (e.g. melanoma, lung tumour or tumour metaetasis), inhibiting cell invasion associated with melanoma, or increasing survival of an animal having a metaetatic tumour. This sequence represents an anti-MUC18 antibody light chain, variable region,

The invention comprises a method for inhibiting cell proliferation associated with expression of MUCIB tumour antigen. The method involves administering anti-MUCIB monoclonal antibody. The method of the invention is useful for inhibiting cell (e.g. melanoma or tumour cell) proliferation associated with the expression of MUCIB tumour antigen, the method is preferably useful for inhibiting tumour metastasis. The method is useful for inhibiting cell proliferation in patients with tumours, carcinomas, cancer and other malignancies. The present amino acid sequence represents a light chain from an MUCIB tumour antigen-specific

New recombinant human monoclonal antibody that specifically binds to Tumor Necrosis Factor-alpha, useful for treating neoplastic disease such as cancers, or immuno-mediated inflammatory diseases such as rheumatoid Babcook JS, Kang JS, Foord O, Green L, Feng X, Klakamp Haak-Frendscho M, Rathanaswami P, Pigott C, Liang ML, Le Manchulencho K, Faggioni R, Senaldi G, Qiaojuan JS;

The present invention describes a human monoclonal antibody (1) that specifically binds to tumour necrosis factor-alpha (TNFa) and comprises:

(a) a heavy chain complementarity determining region 1 (CDR1) having the two fully defined 5 amino acid sequence (S1, ADP22417) or (S2, ADP22421);

c two fully defined 5 amino acid sequence (S1, ADP22417) or (S2, ADP22421);

c two fully defined 5 amino acid sequence (S1, ADP22417) or (S2, ADP22421);

c and (b) a light chain CDR1 having the two fully defined 11 amino acid sequence (S3, ADP22418) or (S4, ADP22424). Also described: (1) assaying (M1) the level of TNFa in a patient sample, comprising contacting with (I), and detecting the level of binding between the antibody and TNFa in the sample; (2) a composition comprising the antibody or its functional and a carrier; (3) treating (M2) an animal suffering from a neopolastic, or an immuno-mediated inflammatory disease by selecting an enopolastic, or an immuno-mediated inflammatory disease by selecting an animal in need of treatment for the disease by administering (M3) TNFa induced apoptosis by administering the human monoclonal antibody of (1); and (4) inhibiting (M3) TNFa induced apoptosis by administering the human monoclonal antibody of (1) antiarteriosclerotic, antirheumatic, eating-antiboacterial, antiinflammatory, antisporiatic, antirheumatic, eating-disease and antiapoptotic activities, and can be used as a TNFa antagoniet. The antibody (1) is useful in the preparation of medicament for treating TNF induced apoptosis, neoplastic disease such as premath cancer, ovarian cancer, binder cancer, lung cancer, glioblastoma, stomach cancer, endometrial cancer, kidney cancer, colon cancer,

This invention relates to novel antibodies, or binding fragments thereof, that bind directly to various drugs of abuse. Specifically, it refers to amman or chimeric monoclonal antibodies that are capable of binding to amphetamine, methamphetamine or phencyclidine (PCP). The present invention describes generating hybridoma cell lines that produce such antibodies and transforming a cell with a gene encoding the antibody, which when conjugated to a therapeut genet, toxin or radiolsotope can be used to treat a patient suffering from a drug addiction. Accordingly, these compositions exhibit antiaddictive activities and can be used for antibody therapy to treat patients suffering from a drug addiction. This polypeptide sequence is a murine light chain variable anti-amphetamine antibody of the invention.

New isolated antibody or its binding fragment that binds specifically to a drug of abuse, useful for treating a patient suffering from addiction to a drug of abuse, e.g. amphetamine, methamphetamine, or phencyclidine.

 This invention relates to novel antibodies, or binding fragments thereof, that bind directly to various drugs of abuse. Specifically, it refers to amman or chimeric monoclonal antibodies that are capable of binding to amphetemine, methambhetamine or phencyclidine (PCP). The present invention describes generating hybridoma cell lines that produce such antibodies and transforming a cell with a gene encoding the antibody, which when conjugated to a therapeutic agent, toxin or radioisotope be used to treat a patient suffering from a drug addiction. Accordingly, these compositions exhibit antiaddictive activities and can be used for antibody the reapty to treat patients suffering from a drug addiction. This polypeptide sequence is a murine light chain variable anti-amphetamine antibody of the invention.
 9
 9
 New isolated antibody or its binding fragment that binds specifically to a drug of abuse, useful for treating a patient suffering from addiction to a drug of abuse, e.g. amphetamine, methamphetamine, or phencyclidine.
 Murine light chain variable anti-amphetamine antibody protein SeqID 36.
HEK293 cells are transfected with the plasmid pCEP4/Sec-30664188. This sequence corresponds to a protein used in the invention.

The invention relates to a method of modulating insulin activity in mammalian cells by administering a peptide that binds the insulin receptor (IR). A composition containing a peptide, optionally expressed from gene therapy vectors, that binds to Site 1 of IR and an insulin agonist are useful for treating diabetes. Also, peptides that are antagonists of the insulin-like growth factor: I (IGF-1) receptor are useful for treating insulin-like growth factor (IGF)-sensitive tumours (e.g. of prostate and breast) and diabetic retinopathy, while IGF-1 receptor agonists are useful for treating neurological diseases, including stroke and diabetic neuropathy. The peptides are also useful in screening for compounds that bind to IR or IGF-1 receptor, potential therapeutics and research reagents. AAU88034-AAU80957 represent IR and/or IGF-1 receptor-binding peptides and related amino acid sequences of the

06-JAN-2003; 2003WO-US000398. 07-JAN-2002; 2002US-00041860 New human monoclonal antibody that binds to platelet-derived factor-D (PDGF-D), useful for treating chronic and recurrent diseases, such as inflammation, autoimmunity and cancer.

Disclosure; SEQ ID NO 257; 255pp; English

```
The invention relates to a human monoclonal antibody that binds to platelet-derived growth factor-D (PDGF-D). The antibodies are useful for treating chronic and recurrent human diseases, such as inflammation, autoimmunity and cancer. The PDGF-D nucleic acids and polypeptides are useful for modulating collagen formation, and for staging various cancers. Antibodies to platelet-derived growth factor-D (PDGF-D) were generated using an active protein fragment of the gene product from the clone 30664188 to 99 arising in the conditioned medium obtained when HEK293 cells are transfected with the plasmid pCEPA/Sec-30664188. This sequence corresponds to a protein used in the invention.

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

disease New human anti-MUC18 monoclonal antibodies, useful for treating a dor condition associated with expression of MUC18 in a patient, e.g. tumors, cancers, and other malignancies.

Claim 3; SEQ ID NO 34; 78pp; English,

The invention relates to a novel isolated monoclonal antibody comprising a heavy or light chain amino acid or a heavy or light chain variable domain where the antibody binds to WIC18. The monoclonal antibody of the invention demonstrates cytostatic activity and may be useful for treating a disease or condition associated with the expression of WIC18 on the cell surface such as tumours, specifically melanoma, ossophageal, pancreatic or colorectal tumours, carcinomas, particularly cervical carcinomas and cervical intraepithelial neoplasia and cancers including colorectal, breast or lung canneer, as well as other malignancies. The current sequence is that of the anti-human WIC18 monoclonal antibody

The invention relates to a novel monoclonal antibody used for inhibiting tumour growth in an animal. The tumour inhibition process comprises selecting an animal in need of treatment for a tumour, providing a monoclonal antibody comprising a heavy chain amino acid, where the antibody consists of any one of 10 fully defined sequences of 117-123 anino acids given in the specification, and where the monoclonal antibody binds MUC18, and contacting the tumour with the antibody resulting in inhibited proliferation of the cells. The monoclonal antibody has cytostatic and can be used in the production of a vaccine. The monoclonal antibodies against the MUC18 antigen are useful for diagnosing and creating tumours, inhibiting tumour growth (e.g. melanoma, lung tumour or tumour metastasis), inhibiting cell invasion associated with melanoma, or increasing survival of an animal having a metastatic tumour. This sequence represents an animal having a metastatic tumour. This protein of the invention.

 The invention comprises a method for inhibiting cell proliferation associated with expression of MUC18 tumour antigen. The method involves administering anti-MUC18 monoclonal antibody. The method of the invention is useful for inhibiting cell (e.g. melanoma or tumour cell) proliferation associated with the expression of MUC18 tumour antigen, the method is preferably useful for inhibiting tumour metastasis. The method is useful for inhibiting cell proliferation in patients with tumours, carcinomas, cancer and other malignancies. The present amino acid sequence represents a light chain from an MUC18 tumour antigen-specific

 The invention relates to a novel monoclonal antibody used for inhibiting tumour growth in an animal. The tumour inhibition process comprises selecting an animal in need of treatment for a tumour, providing a monoclonal antibody comprising a heavy chain amino acid, where the antibody comprising a heavy chain amino acid, where the antibody consists of any one of 10 fully defined sequences of 117-123 amino acids given in the specification, and where the monoclonal antibody binds MUC18, and conteacting the tumour with the antibody resulting in inhibited proliferation of the cells. The monoclonal antibody has antibodies against the MUC18 antigen are useful for diagnosing and treating tumours, inhibiting tumour growth (e.g. melanoma, lung tumour or tumour metasteasis), inhibiting cell invasion associated with melanoma, or increasing survival of an animal having a metastatic tumour. This sequence represents an anti-MUC18 antibody light chain, variable region,

New recombinant human monoclonal antibody that specifically binds to Tumor Necrosis Factor-alpha, useful for treating neoplastic disease such as cancers, or immuno-mediated inflammatory diseases such as rheumatoid arthritis.

Example 10; SEQ ID NO 313; 213pp; English.

The present invention describes a human monoclonal antibody (I) that specifically binds to tumour necrosis factor-alpha (TNFa) and comprises:

(a) a heavy chain complementarity determining region I (CDR1) having the two fully defined 5 amino acid sequence (S1, ADP22417) or (S2, ADP22421); and (b) a light chain CDR1 having the two fully defined 11 amino acid sequence (S3, ADP22418) or (S4, ADP22424). Also described: (1) assaying (M) and detecting the level of binding between the antibody and TNRa in the sample; (2) a composition comprising the antibody or its functional fragment and a carrier; (3) treating (M2) an animal suffering from a neoplastic, or an immuno-mediated inflammatory disease by selecting an animal in need of treatment for the disease by administering the human concolonal antibody of (I); and (4) inhibiting (M3) TNRa induced apoptosis by administering the human monoclonal antibody of (I); and (4) inhibiting (M3) TNRa induced apoptosis by administering the human monoclonal antibody of (I); and induced apoptosis by administering the human monoclonal antibody of (I); (I) has anabolic, antiarteriosclerotic, antirheumatic, eating-clisotherial, antiinflammatory, antipoptotic activities, and can be used as a TNRa antegoniar. He antiabody (I) is useful in the preparation of medicament for treating TNF induced apoptosis, neoplastic disease such as a TNRa and prostrate cancer, lung cancer, colon cancer, pancreatic cancer, ovarian cancer, kidney cancer, colon cancer, pancreatic cancer, and prostrate cancer, or immuno-mediated inflammatory diseases such as theumatoid arthritis, glomerulonephritis, pancreatic and arthritis, glomerulonephritis, antendence of the cancer, or immuno-mediated inflammatory antender cancer, or immuno-mediated inflammatory attribution antender cancer, and prostrate cancer, or immuno-mediated inflammatory attribution antender cancer, and prostrate cancer, or immuno-mediated inflammatory attribution antender cancer antender cancer antender cancer antender cancer antender cancer antende atherosclerosis, psoriasis, restenosis, autoimmune disease, Crohn's disease, graft-host reactions, septic shock, cachexia, anorexia, and

 The present invention relates to an antibody comprising a variable light chain region or a variable heavy chain region. The antibody and methods are useful for treating a disorder associated with an abnormally high IgE level, e.g. asthma, allergic rhinitis, eczema, urticaria, atopic dermatitis, or a food allergy. The present sequence represents human anti-IgE antibody light chain combined L16 and JK4.

 The invention relates to a method for generating a humanised high affinity antibody from an antibody of interest. The method involves selecting a suitable human template as the framework for the H (heavy) and L (light) chain variable (V) domains of the high affinity antibody to be made. The method is useful for generating high affinity antibodies useful in diagnostics, prophylaxis and treatment of diseases. The present sequence is Li6/JK4 human light chain consensus sequence template. This sequence is used in the exemplification of the invention.

New human anti-MUC18 monoclonal antibodies, useful for treating a disease or condition associated with expression of MUC18 in a patient, e.g. tumors, cancers, and other malignancies.

Claim 3; SEQ ID NO 38; 78pp; English.

a heavy or light chain amino acid or a heavy or light chain variable domain where the antibody binds to WUC18. The monoclonal antibody of the invention demonstrates cytostatic activity and may be useful for treating a disease or condition associated with the expression of MUC18 on the cell surface such as tumours, specifically melanoma, oesophageal, pancreatic or colorectal tumours, carcinomas, particularly cervical carcinomas and cervical intraepithal neoplasia and cancers including colorectal, breast or lung cancer, as well as other malignancies. The current sequence is that of the anti-human MUC18 monoclonal antibody The invention relates to a novel isolated monoclonal antibody comprising

 The invention relates to a novel monoclonal antibody used for inhibiting tumour growth in an animal. The tumour inhibition process comprises selecting an animal in need of treatment for a tumour, providing a monoclonal antibody comprising a heavy chain amino acid, where the amonoclonal antibody comprising a heavy chain amino acid, where the antibody consists of any one of 10 fully defined sequences of 117-123 amino acids given in the specification, and where the monoclonal antibody binds MUC18, and contacting the tumour with the antibody resulting in linhibited proliferation of the cells. The monoclonal antibody has cytostetic and can be used in the production of a vaccine. The monoclonal antibodies against the MUC18 antigen are useful for diagnosing and
 treating tumours, inhibiting tumour growth (e.g. melanoma, lung tumour or tumour metastasis), inhibiting cell invasion associated with melanoma, or increasing survival of an animal hatib an estastatic tumour. This sequence represents an anti-MCC18 antibody light chain, variable region,

The invention comprises a method for inhibiting cell proliferation associated with expression of MUC18 tumour antigen. The method involves administering anti-MUC18 monoclonal antibody. The method of the invention is useful for inhibiting cell (e.g. melanoma or tumour cell) proliferation associated with the expression of MUC18 tumour antigen, the method is preferably useful for inhibiting tumour metastessis. The method is useful for inhibiting tumour metastessis. The method carcinomas, cancer and other malignancies. The present amino acid sequence represents a light chain from an MUC18 tumour antigen-specific Inhibiting cell proliferation associated with expression of MUC18 tumor antigen, involves incubating and inhibiting cell by administering anti-MUC18 monoclonal antibody. Claim 3; SEQ ID NO 38; 83pp; English.

The invention relates to a specific binding agent, which comprises at least one peptide selected from any of 62 peptides (ABR55769-830) or its fragment. The binding agents are antibodies that recognize and bind to angiopoietin-2 (Ang-2). The specific binding agent, particularly the antibody, is useful for inhibiting undesired angiogenesis, treating cancers, inhibiting undesired angiogenesis, modulating or inhibiting Ang-2 activity, modulating vascular permeability or plasma leakage, or treating a disease (e.g. ocular neovascular disease, obesity, haemangioblastoma, haemangioma, arteriosclerosis, inflammatory disease, inflammatory disease, inflammatory disease, atherosclerosis, endometriosis, neoplastic disease, bone-related disease, or psoriasis) in a mammal. The present sequence represents a kappa chain variable region of an anti-Ang-2
 New specific binding agents (i.e. anti-Angiopoietin-2 antibodies), useful for inhibiting undesired angiogenesis, or treating e.g. cancers, obesity, hemangioma, arteriosclerosis, atherosclerosis or endometriosis.

The invention relates to a novel isolated monoclonal antibody (mAb) comprising a heavy chain polypeptide and light chain polypeptide having a sequence chosen from one of 53 fully defined amino acid sequences given in the specification, where the antibody specifically binds carbonic anhydrase IX (CA IX) tumour antigen. The antibody of the invention demonstrates cytostatic activity and may be useful for treating a tumour, such as coloractal nooplasm, renal cell carcinoma, cervical arreaphith and antibody of the invention of tumour or breast cancer, possibly via gene therapy. The current sequence is that of a murine-expressed anti-human CA IX monoclonal antibody VL (light chain variable domain) protein of the invention. The protein was generated via the introduction of the human CA IX protein into

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (CVID) and immunodeficiency (CVID) and interpretation interpret

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 13q34 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single contain antibody molecules (ecfevs) derived, preferably, from the variable contains region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The correct invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including myasthenia gravis and multiple solerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as AIDS and proliferative disorders including leukaemia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various activities such as antirheumatic, antiallersgic and cytostatic. This polypeptide sequence las a single chain antibody that binds BLyS of the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format
 Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.

 The present invention describes a human monoclonal antibody to parathyroid hormone related protein (PTHrP). The monoclonal antibody or lite fragments, following the stimulation of PTHrP has the following properties: (a) inhibits intracellular elevation of CAMP; (b) inhibits the release of calcium from bone; or (c) inhibits elevation of blood calcium content. The monoclonal antibody can be used in the treatment of hypercalcaemia, rheumatoid arthritis, cancer of bone including metastasis, pain, fracture, cachexia, diseases of teeth, periodontal diseases and gingiva, sepsis, systemic inflammatory response syndrome (SIRS) and hypophosphateaemia. It has antiarthritic, cytostatic and antiinflammatory activities. The present sequence represents a human PTHRP monoclonal antibody clone protein sequence from the present

New specific binding agents (i.e. anti-Angiopoietin-2 antibodies), useful for inhibiting undesired angiogenesis, or treating e.g. cancers, obesity, hemangioma, arteriosclerosis, atherosclerosis or endometriosis.
 The invention relates to a specific binding agent, which comprises at least one peptide selected from any of 62 peptides (ABR55769-830) or its fragment. The binding agents are antibodies that recognize and bind to angiopoietin-2 (Ang-2). The specific binding agent, particularly the antibody, is useful for inhibiting undesired angiogenesis, treating cancers, inhibiting undesired angiogenesis, modulating or inhibiting Ang-2 activity, modulating vascular permeability or plasma leakage, or treating a disease (e.g. ocular neovascular disease, obesity, haemangioblastoma, haemangioma, arteriosclerosis, inflammatory disease, inflammatory disease, inflammatory disease, or psoriasis) in a mammal. The present sequence represents a kappa chain variable region of an anti-Ang-2

platelet autoantibody; (15) treating (M12) idiopathic thrombocytopenic purpura (ITP) in a mammal; and (16) a kit for reversibly inhibiting blood clotting, inhibiting platelet aggregation, inhibiting platelet function or inhibiting platelet activation comprising an amount of an anti-completed activation comprising an amount of an anti-completed autoantibody, or its biologically active fragment that specifically binds with glycoprotein IIb/IIIa, where the autoantibody, or its fragment comprises an antigen binding region derived from an H44L4 anti-platelet autoantibody, the kit further comprising a peptide inhibitor of the binding with glycoprotein IIb/IIIa, and an applicator and an instructions for use. (I) has haemostatic, anticoagulant and thrombolytic activities. The autoantibodies (I) are useful for diagnosing and for developing therapeutics for diseases mediated by autoantibody binding with platelet antigens. (M6) and (M12) are useful for treating thrombocytopenic purpura had (M3) are useful for inhibiting blood clotting. The present sequence is used in the exemplification of the

```
for inhibiting undesired angiogenesis, or treating e.g. cancers, obesity, hemangioma, arteriosclerosis, atherosclerosis or endometriosis.
```

Claim 1; Page 93; 161pp; English

The invention relates to a specific binding agent, which comprises at least one peptide selected from any of 62 peptides (ABR55769-830) or its fragment. The binding agents are antibodies that recognize and bind to angiopoietin-2 (Ang-2). The specific binding agent, particularly the antibody, is useful for inhibiting undesired angiogenesis, treating 2 activity, modulating vascular permeability or plasma leakage, or treating a disease (e.g. ocular neovascular disease, obesity, haemangioblastoma, haemangioma, arteriosclerosis, inflammatory disease, inflammatory disease, or psoriasis) in amammal. The present sequence represents a kappa chain variable region of an anti-Ang-2
